Requirements

Gas or air humidity measurements are becoming more and more important. Constant improvements to the technical processes, higher demands on quality and energy saving require an accurate, stable and affordable measuring procedure to measure air humidity.

Different measuring methods

Hair hygrometer	Psychrometer	Dew point mirror	Capacitive humidity sensor
<p>The hair hygrometer is one of the oldest methods used to measure humidity. The length of the hairs changes in accordance with the ambient humidity. This change is mechanically indicated as relative humidity.</p>	<p>A temperature probe covered usually with a damp cotton sleeve cools down as a result of evaporation. A second temperature probe measures the ambient temperature. The ambient humidity can be determined from the difference in temperature.</p>	<p>A mirror is cooled until it shows condensation after having reached the dew point temperature. The condensation on the mirror is monitored and the dew point is then measured.</p>	<p>A condensator changes its capacity in accordance with the ambient humidity.</p>

## testo 635-1/-2

Long-term drift-free and reliable humidity measurement

The new testo 635 provides the possibility of monitoring and analysing air humidity, material moisture (based on equilibrium humidity), U-value and the pressure dewpoint in compressed air systems.

Versatility with wireless probes

In addition to classical probes with wires, wireless measurement up to a distance of 20 m distance is possible. Damage to the wire or hindrances in usage are thus eliminated. A maximum of three wireless probes can be recorded and displayed by testo 635. The wireless probes are available for the measurement parameters temperature and humidity. The optional easily plugged-in radio module can be retro-fitted at any time.

More user comfort

The testo 635 excels through its logical usage and easy-to-follow menus. When making measurements at different locations, the testo 635-2 offers the advantage that the readings are allocated to the respective measurement location.

For long-term measurements and material moisture measurements, it is possible to switch between different user profiles.

testo 635-2 with store and software

The testo 635-2 has a memory for 10,000 readings. With the testo 635-2, characteristic curves for different materials can be laid down using the PC software included in delivery, and carried over into the instrument. Moisture courses can be recorded, analysed and displayed as a graph or table.

## testo 845 with integrated humidity module

For the first time, surface temperatures with smallest diameters can be measured accurately at short and long distances. The switchable optics for far-field and close focus measurement make this possible.

Far-field measurements are carried out at an optical resolution of 75:1. In this way, surface temperatures can be measured accurately even at great distances from the object to be measured. At a distance of 1.2 metres from the object to be measured, the measuring spot diameter is only 16 mm. A cross laser marks the measuring spot exactly during measurement.

During measurements at a short distance from the object being measured, the close focus optics has a spot diameter of only 1 mm at a distance of 70 mm. Two laser points mark the spot exactly.

**testo Saveris base**

The base is the heart of testo Saveris and can save 40,000 readings per measurement channel independent of the PC. This corresponds to around one year of memory capacity at a measuring rate of 15 minutes. An emergency battery ensures that an alarm is transmitted and that no existing data is lost in the event of a power failure.

The system data and alarms are visible via the display of the Saveris base. Even without the PC running, the base issues an alarm by means of an LED if the limit value is exceeded, or optionally via SMS and via a relay output to which an alarm transmitter can be connected.

In total, a base can incorporate 150 radio and Ethernet probes or 254 measurement channels. The Saveris base is connected to the PC either via USB or Ethernet cable. The Saveris base thereby offers flexibility with the highest data security.

**testo Saveris wireless probe**

The testo Saveris radio probes measure temperature and humidity. In the measuring cycle, the probes save the recorded measurement data and send it to the central base at regular intervals. If a limit value is exceeded, a radio link is established immediately. Through bidirectional transmission, the radio probe and the base are in mutual contact. This therefore ensures that the measurement data is only recorded by the base and is not interfered with by other radio systems.

An alarm sounds in the event that the radio link be interrupted by obstacles. The memory in the probe ensures that the measurement data is not lost in the event of an interference in the radio link. An optimized battery design ensures for long running life of the probe memory.

In free field, the transmission path is approx. 300 m at a frequency of 868 MHz and approx. 100 m at a frequency of 2.4 GHz. In buildings, the transmission path is strongly influenced by structural conditions such as walls, refrigerator doors or metal doors. The radio link can be improved or lengthened with poor structural conditions by using a router. Because the radio probe and the router show the quality of their radio link, the probe can personally be positioned optimally by the user.

Probe versions with internal and external sensors allow the adaptation to every application. The radio probes are available with or without a display as an option. Current measurement data, the battery status and the quality of the radio link are shown on the display.

**testo Saveris analog coupler**

The two versions of the analog coupler (wireless/Ethernet) allow the inclusion of further measurement parameters into the testo Saveris monitoring system, by integrating all transmitters with standardized current/voltage interfaces, e. g. 4 to 20 mA or 0 to 10 V.

**testo Saveris™**

**testo Saveris Ethernet probe**

In addition to the radio probes, probes can be used that are directly connected to the Ethernet. The existing LAN infrastructure can be used through this. This allows the data transfer from the probe to the base, even over long distances.

Ethernet probes can be used over any long periods since they are connected to the mains and therefore work independently of batteries. The internal memory guarantees that the existing measurement data is not lost, even with failure of the mains or the LAN connection.

A display informs about the current measurement data as well as the probe status. Different probe versions (probe partially plug-in) adapt to the conditions of the application.

Through the connection of a converter to an Ethernet jack, the signal of a radio probe can be converted into an Ethernet signal. This combines the flexible connection of the radio probe with the use of the existing Ethernet even over long transmission paths.

**Humidity transmitter testo 6651/6681**

Thanks to the integration of the humidity transmitter, measurement data monitoring is possible parallel to the control. This provides the solution for highest accuracy as well as for special applications (high humidity, trace humidity etc.) in compressed air, drying and air conditioning technology.

Find out more at [www.testo.com/transmitter](http://www.testo.com/transmitter)

**testo Saveris software**

The measurement data is transmitted from the base to a PC on which the testo Saveris software is installed within just a few minutes using an installation assistant. The initial system and probe configuration is also performed using the software.

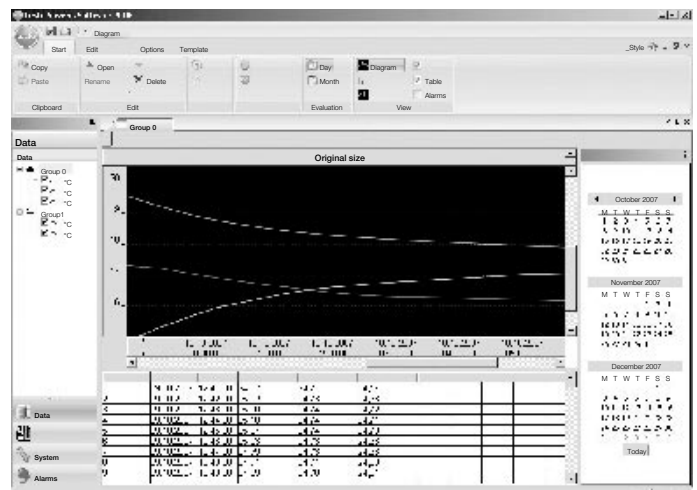

All measurement are saved centrally in the software's database and can be called up any time as a table or a graph. All alarms that occur are listed in a table as a history. The automatic creation of PDF reports in defined intervals also simplifies the documentation. Using the calendar function and the consolidation of probes into groups, the operation of the software is simple and intuitive.

In the event of an alarm the user can choose between receiving a message via e-mail or an alarm directly on the screen.

The Saveris software is available in two different versions. The basic version SBE (Small Business Edition) enables the appeal basic functions of the software. Die PROF (Professional) software version offers interesting additional functions, e.g.:

- The integration into the network via Ethernet. Constant monitoring of the measurement data is thereby possible. The measurement data can be monitored by various PCs integrated into the network.
- Photographs of machines or rooms can be saved as a picture. The respective measurement values are shown directly at the position of the probe in the room or at the machine in these. The link between the location and the measurement value is thus very easily visualized (s. picture).
- A comprehensive alarm management offers the option of alarming more than two people at the same time or in succession. Depending on the day of the week and the time, you can freely choose whether an alarm is sent via e-mail or SMS.

Probe versions with internal and external temperature sensors and with humidity sensors allow the adaptation to every application. The radio probes are available with or without a display as an option. Current measurement data, the battery status and the quality of the radio link are shown in the display.

**testo 581**

**Alarm switching for forwarding alarm reports for testo 175/177**

The alarm signal output testo 581 makes it possible to send alarm messages to external components, e.g.: horns, lamps, PLC.

**Alarm is triggered when:**

- Programmed limit values in the data logger are exceeded
- Logger is stopped due to spent battery
- Probe is disconnected
- Alarm unit battery is spent

External components are connected via a terminal strip in the battery compartment of testo 581, the signal is transferred via the floating signal output. This can be set as an NC or NO contact.

**The control functions**

You will be informed directly at the touch of a button, if the alarm has already been triggered. The alarm of the external components, e.g. the horn, can be reset using the reset button.

## ComSoft 4 - Basic

The Basic version has all the functions needed to monitor, analyse, save and print data. The limit values to be monitored can be defined as required; short titles, text fields and channel names ensure clear allocation if several loggers are in use.

Once read out, the data can be shown in table or line graphics and then analysed.

The e-mail address of the desired recipient can be entered when programming so that data can be easily forwarded through your locally installed e-mail program by simply clicking on "Send...". The saved e-mail address is then entered in the address box.

## Easy operation and convenient analysis for testo 175/177

### Additional functions:

- Axes can be scaled as required
- Frequently used scales can be saved for future use
- Printout as table or graphic on all printers compatible with Windows
- Data export to other applications via clipboard

## Ethernet adapter

## With testo measuring instruments in Ethernet

### The new Ethernet adapter facilitates:

- Measurements on site, e.g. production, warehouses, incoming goods
- Measuring instrument remains on site, transport not necessary
- Data can be checked from office
- Centralised data filing

### Ethernet offers:

- Fast transfer of readings
- Use of an existing network without additional cabling
- Long transmission paths
- Identification of measuring instruments in system network

### Long-term monitoring of climate data

The parameters temperature and humidity are logged and saved on site by the data logger. Using the Ethernet adapter, the measurement data saved in the logger can be read out and filed via the PC network. The data is easily analysed and checked on the PC in your office.

The Ethernet adapter has the following benefits:

- Affordable handling since it is not necessary to read the data on location or to take the logger into the office
- Short access times because you can quickly access the current measurement data at any time.

**Ethernet adapter, RS232 - Ethernet incl. software driver, mains unit facilitates data communication in network (not for use in Ex-zone)**

Part no.  
**0554 1711**

### Multi-point checks on site

Spot checks are carried out on site in production halls or in incoming goods departments using Testo handheld measuring instruments. The measurement data can be sent immediately to a central office via the Ethernet adapter. This facilitates fast reaction times if further actions are required.

## Huminator

The Huminator is one of the smallest and therefore one of the most suitable climate chambers available on the market for mobile as well as stationary applications. Humidity readings in the range from 5 to 95%RH can be determined quickly and efficiently stabilised. The built-in temperature control function generates temperatures in the range from 15° to 40°C. Using an appropriate reference, it is possible to carry out fast and easy humidity calibrations on the measuring instruments, probes and data loggers from Testo and other manufacturers. The desk-top instrument is ideally suitable for testing the performance of all types of material, electronic components and instruments under special climatic conditions. The timed programming function facilitates extensive automation of test runs and calibrations, since up to 3 humidity/temperature readings can be activated one after the other. The time for this can be defined by the user.
